

Detailed Scoring Guide and Anchors

Requirements Metrics (EEI)

Metric	5 = Excellent	4 = Good	3 = Adequate	2 = Weak	1 = Very Poor
Semantic Accuracy (SA)	Requirements correctly reflect intended functionality with no material misinterpretation.	Mostly accurate with minor interpretation issues.	Partially accurate but several unclear or questionable interpretations.	Major misinterpretations of sketch intent.	Requirements do not reflect the sketch or scenario.
Requirement Coverage (RC)	All visible and implied core elements are covered.	Most core elements covered; only minor omissions.	Several elements omitted or only vaguely represented.	Many important elements missing.	Coverage is minimal or absent.
Novelty Precision (NP)	No unsupported/hallucinated functionality; assumptions are clearly labeled.	Minor reasonable additions that do not distort intent.	Some unsupported additions that may need removal.	Several hallucinated or unjustified functions.	Output is dominated by unsupported functionality.
Clarity & Readability (CR)	Clear, concise, stakeholder-readable, and consistently formatted.	Readable with minor wording or organization issues.	Understandable but verbose, inconsistent, or sometimes ambiguous.	Difficult to interpret; poor structure or unclear language.	Not understandable as requirements.
Consistency (CO)	No contradictions across requirements.	Minor wording inconsistencies only.	Some tension or unclear dependencies.	Clear contradictions or conflicting behavior.	Internally inconsistent or unusable.

Prototype Metrics (PAI)

Metric	5 = Excellent	4 = Good	3 = Adequate	2 = Weak	1 = Very Poor
Visual Fidelity (VF)	Layout, spatial relationships, and visible components strongly match sketch.	Mostly matches sketch with minor visual differences.	Recognizable but misses several layout details.	Major layout mismatch or missing components.	Does not resemble the sketch.
Functional Alignment (FA)	Interactions and UI behavior align with requirements and sketch intent.	Most interactions align; minor issues.	Basic behavior present but incomplete.	Major interaction gaps or incorrect behavior.	Prototype behavior does not support the intended workflow.
Structural Code Quality (SCQ)	Clean, organized, maintainable single-file HTML/CSS/JS; no obvious broken code.	Generally organized with minor redundancy.	Usable but repetitive or difficult to maintain.	Messy, fragile, or partially broken code.	Code is unusable or cannot render.
Human-Perceived Usability (HPU)	Intuitive, easy to navigate, and suitable for early stakeholder validation.	Mostly intuitive with minor friction.	Usable but with noticeable confusion or missing feedback.	Difficult to use or poorly organized.	Not usable for stakeholder review.

Reviewer Decision Rules

Situation	Recommended Scoring Rule
Feature is plausible but absent from sketch and not requested in prompt	Lower Novelty Precision; explain in Comments_Issues.
Feature is visible in sketch but not included in requirements	Lower Requirement Coverage.
Prototype looks good but does not support intended workflow	High HPU may still be possible, but lower Functional Alignment.
Requirement is grammatically clear but semantically wrong	High clarity is possible, but lower Semantic Accuracy.
Prototype renders but code is redundant or hard to maintain	Lower Structural Code Quality only; do not lower Visual Fidelity unless appearance is affected.
